AND MUCH MORE...

Springs installation

It is important to check the tension of the~ springs. Disregard the electric door opener, if you have one, and try to open the door manually.

Is it difficult to raise or lower garage door
A well-balanced garage door should not weigh more than 10 to 20 lbs. An extended spring, a bent rail, or a sprung cable can be the cause of a malfunction.

If you have difficulty moving the door, contact us immediately.

Do not attempt to adjust the springs yourself.
The system is under strong tension and could be dangerous.

The risk of changing the springs yourself could result in great injury or even death. NOTICE...

Consider your garage door as an important part of your building and make a detailed inspection each year. Ask us to check your garage door at least once a year. We will carry out a 10-step inspection, lubricate the system and make all necessary repairs.
